

Channels × AI Design Proposal Test

AI Reimagines the Video Creation Workflow

Embedded AI capabilities that lower creation cost and boost content productivity.

Design Background

Channels Development Trends

Industry Trends

WeChat's deep ecosystem integration has driven Channels from "social distribution" toward "content depth." Content output has exploded, and creation has shifted from a professional privilege into an everyday form of social expression.

User Profile

Core creators are primarily general lifestyle documenters and vertical-niche leaders aged 18-45.

AI Trends

Most social platforms and editing apps have integrated AI editing. Editing is evolving from "tool-oriented" to "intent-oriented." AI is no longer a simple automation plugin but an intelligent Copilot that understands creator intent.

Core Problems

Mechanical

Fixed templates, lacking narrative logic between clips.

Low Creative Ceiling

Only animated scaling — unable to produce truly "new content."

Lack of Perception

Cannot understand video content, causing music and visuals to mismatch.

Competitive Analysis

Xiaohongshu

Limitations

Biased understanding with limited control; unstable generation makes precise user refinement difficult.

Features

Focuses on ambiance; offers AI image expansion and chatbot fine-tuning.

CapCut

Limitations

Extremely heavy interactions. Feature overload creates a steep learning curve and high barrier.

Features

All-in-one tool with a very high degree of AI automation.

Design Goals

Use AI throughout the creative workflow, not as single-point tool optimizations.

Embed Into Existing UI

Preserve existing habits without adding complex flows

Channels users already follow a stable path, so they don't need to relearn: Enter → Generate → Edit → Publish
Keep WeChat's design style: restrained and non-intrusive.

Embed AI capabilities into existing key moments

Lower the Creation Barrier

Enable everyday users to make high-quality videos

Everyday users lack professional scripting knowledge, filming gear, and editing skills. They often don't know what to shoot, how to shoot, or how to edit — which reduces their willingness to create.

AIGC-Generated Clips

Creation Suggestions

Instant & Controllable

Results shown instantly, personalized anytime

Existing video-generation AI lacks control and can't be modified. Creators should be able to see, control, and adjust changes to produce content that truly matches their expectations.

Generated from user instructions

Clips can be personalized

Design Decisions

Core Pain Points

Don't know what to shoot

Don't know how to edit

Don't have enough clips

Design Solution

Part One
AI One-Tap Video

Part Two
AI Editing

 Figma Interactive Prototype

Part One: AI One-Tap Video

Original Channels One-Tap Video

Original Interaction Flow

Select Clips > Apply Template >
Auto-Stitch > Finish & Publish

Existing Problems

Just auto-stitching, not creation

- Fixed Templates
- Can't Understand Content
- Monotonous Output
- Templates don't match content

Part One: AI One-Tap Video New Approach — From Stitching to Creating

Improved Interaction Flow

Select Clips > Add generation settings > AI Generation

Add AI instructions
AI analyzes content
AI script generation
AIGC video clips with matching style
Add reference videos

One-Tap Video AI ✨

AI One-Tap Generation Screen

Improvement Results

AI no longer just stitches clips — it creates based on user instructions.

Understands content

Personalized output

Professional editing suggestions and additions

Part One: AI One-Tap Video

AI Understands Your Needs

Problem: Existing AI video output often fails to meet audience expectations; auto-generation is just template-style clip filling.

Feature 1

Reference Video Fusion

Rather than making users search through thousands of templates, the system uses AI to learn pacing and deeply understand the aesthetic preferences in your saved items, turning reference clips into creative inspiration.

Feature 2

Write the AI Video Generation Prompt

Writing an AI generation prompt makes the one-tap video match your expectations more closely. A conversational input supports both text and voice.

I want to edit a travel video in a creative, artsy style |

Feature 3

Choose Tags

AI style matching automatically calibrates audiovisual language to the video's theme, capturing stylistic essence and unifying visuals with the tone of the title.

Part One: AI One-Tap Video

AI Conversational Intent-Based Creation

Feature 4

AI Interprets Clips and Offers Suggestions

AI deeply understands video semantics — not only answering creative bottlenecks but proactively recommending generation directions based on visual tone. Through natural-language interaction it precisely fills narrative gaps, markedly improving logical completeness and visual quality.

Problem: Everyday users lack professional scripting ability and audiovisual language experience, so captured clips can't be effectively connected, making it hard to produce high-quality, shareable content.

From instruction-based interaction to deep co-creation

Smart script parsing

Holistic aesthetic diagnosis

Narrative inspiration capture

1. Fast-cut processing: I can use AI to automatically chop long shots into 0.5s-1s jump cuts.
2. Add dynamic clips: I suggest generating some

Part One: AI One-Tap Video

AIGC Supplementary Clips

Problem: Everyday users often run into missing or low-quality clips, leading to disjointed creation.

Feature 5

AIGC-Generated Video Clips

Users give instructions through simple natural-language dialogue. AI generates highly matched fill-in footage based on context and style, with fast filtering and batch acceptance.

Result

Dramatically reduces reshoot and sourcing costs, making editing as easy as chatting.

Part Two: AI Editing

Original Channels Editor

Existing Problems

Editing tools can't support complex, high-volume creation

- Weak per-clip editing
- Complex, monotonous effects
- Requires manual work
- Complicated feature operations

Added while keeping existing features:

New global AI editing module

AI-generated decorations

AI editing of individual clips mid-edit

Part Two: AI Editing

Clip-Level AI Editing

Problem: Adjusting clips one by one is tedious, the best result is hard to judge, and detail work is complex.

Bring videos closer to
creators' expectations

Shorten the intro

Add music

Add subtitles

Faster pace

Add transitions

Select the clip to modify

Describe the desired edit
/ tap an AI smart suggestion

AI edits the video
clip

Part Two: AI Editing

AI-Generated Personalized Decorations

Problem: Users lack design skills, hunting stickers manually is time-consuming, and clip styles end up inconsistent.

Lower the design barrier, enhance video expressiveness

- Type or speak to generate stickers
- Auto-match the video's style
- Finish decoration design quickly

Part Two: AI Editing

Conversational Editing Assistant

Problem: Too many feature entry points, long operation paths; beginners struggle to find the right tool; multi-step operations hurt efficiency.

Turn complex editing into simple expression

Shorten the intro

Add music

Add subtitles
